“I wanted my work to be in architectural harmony with the building.” He accomplished this through treating the subject in an extremely modern manner. The vertical lines of the building are retained in the lines of the statue. While thoroughly contemporary in materials and design, *Ceres*’s solidity and symmetry also suggest the influence of ancient Greek and Egyptian sculpture.

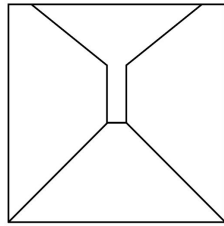

“The first point I have accomplished is through treating the subject in an extremely modern manner. The vertical lines of the building itself are retained in the lines of the statue. Because of the great height at which it will stand the matter of detail did not have to be taken into consideration. The outline of a woman’s figure is suggested rather than rendered exactly.” (Chicago Tribune, May 4, 1930)

CONSCIOUS OF SPACE / TIME

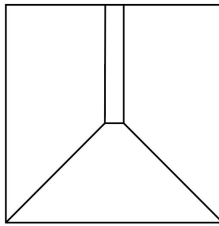

The word ‘Timeless’ is a relatively modern term. The styles of ancient Egyptian art and Roman art are seen as classic for the whole years, but to be called timeless was only after the beginning of 20th century.

The Art Deco revises what is considered to be past to be in the present through revoking the qualities of the past into the modern one. That includes, symmetry, frontality, geometrical form, hieroglyphic patterns that are seen again in the cityscape of modern society through the use of steel frames.

The museum space acts as a translator of the past works with the present audiences. The moment of audiences moving from the work Stela of Amenemhat and Hemet and Relief Plaque, representing the past, to the Ceres, is represented as a trajectory of different time and space.
